

The Commission internal use of Artificial Intelligence

October 2025

Leading by example: The European Commission is striving to become a modern, responsible and adaptive institution by implementing robust AI initiatives under the AI@EC Communication. These initiatives ensure that AI development and use within the Commission are lawful, safe, and trustworthy.

Driving responsible AI uptake

- **Clear Guidelines:** The Commission has developed comprehensive guidelines for AI use, development, procurement, and cybersecurity for its Staff. This includes resources on generative AI, data management, supercomputing, sustainability, and open-source development, alongside practical tools like FAQs on intellectual property and an AI guide for managers.
- **Risk-Based AI Register:** AI systems in development or use are classified based on a risk-driven methodology aligned with the AI Act, tracked in an internal register to ensure compliance and facilitate reporting.
- **Ongoing Oversight:** The Interservice Steering Group on AI regularly monitors internal AI initiatives, such as the development of new tools, training, corporate communication and guidelines, ensuring they align with the Commission's goal of fostering the use of safe and trustworthy AI.

Empowering an AI-Skilled Workforce:

- **Training and Community:** The Commission fosters AI literacy through training programmes, the AI@EC portal for knowledge sharing, the AI@EC Network for community practice, and peer learning via the AI Champions network. An internal survey helps identify gaps in AI tool adoption.

Some examples of how AI helps Commission Staff:

- Support with **repetitive or administrative tasks**.
- **Support evidence-based policy making** by helping staff navigate vast amounts of information.
- Support **multilingualism**.

GPT@EC: An in-house generative AI tool available to all staff, with API access to enhance other systems. Its code is expected for a first open-source release in 2026.

Language tools such as e-Translation and others, provide new capabilities thanks to new generative AI features.

AI4DRPM (AI for Digital-Ready Policy-Making):

Digital statements are now attached to every legislative proposal. AI4DRPM is a system analysing draft legislation, detecting and classifying digital relevance and producing a draft digital statement expected for every legislative proposal. Policy officers remain in full control, finalising the output.
